

BIODEGREASER

THE BIOLOGICAL TREATMENT FOR GREASE TRAPS & DRAIN LINES

BIO-DEGREASER is a bioenhanced product for eliminating the build-up of troublesome grease and fats in restaurants, hotels, canteens and other areas with problems caused by organic matter in drainage systems. It is a safe, economic and proven method compared to alternatives.

A BIOLOGICAL PROCESS

BIO-DEGREASER biologically digests grease and other organic waste build up, turning it into carbon dioxide (CO₂) and water (H₂O). The micro-organisms in **BIO-DEGREASER** go to work as soon as they contact waste, anywhere in the plumbing system (grease traps, joints and drain lines) breaking down and digesting grease and solid waste wherever it accumulates. This action keeps drain lines and grease traps functioning properly as long as treatment is applied.

APPLICATION

BIO-DEGREASER can be used in restaurants, hotels, hospital/factory canteens and other areas with problems caused by grease and fats in drainage systems.

BIO-DEGREASER is a complete treatment system combining product and a fully automatic dispensing pump to ensure correct application. Typical application will be through any main sink or drain line that empties into the grease trap. The dispensing pump is programmed to dose product at the period of lowest flow, usually after clean up, to allow maximum retention time in the system. The pump delivers a maintenance dose of 500 mL of product at night. Dosage rates will need to be increased for large systems or wastes with a high fat / grease loading.
